

4. Employee Management & Role-Based Access Control Module

4.1 Candidate Approval & Employee Onboarding

4.1.1 Approve Job Offer by Candidate

As a candidate,
I want to accept the job offer,
so that HR can proceed with onboarding and system access preparation.

When the candidate accepts the job offer, the system updates the candidate status to *Offer Accepted* and triggers the onboarding process.

Acceptance Criteria

- Candidate can accept the job offer
- Candidate status updates to *Offer Accepted*
- HR is notified automatically

4.1.2 Create Employee Profile from Approved Candidate

As an HR staff member,
I want to create an employee profile after a candidate accepts the offer,
so that the employee can be added to the system accurately.

HR selects an approved candidate and initiates employee profile creation.
The system pre-fills employee details using CV and recruitment data.
HR can review, edit, and add additional information before saving the profile.

Acceptance Criteria

- Only approved candidates can be converted to employees
- Employee details are pre-filled from CV and profile data
- HR can edit and add missing details
- Employee profile is created successfully

4.2 Role & Permission Management

4.2.1 Create System Permissions

**As an admin,
I want to create system permissions,
so that access control can be configured flexibly across modules.**

The admin defines permissions such as view, add, edit, delete, or approve and assigns them to specific system modules.

Acceptance Criteria

- Admin can create new permissions
- Permissions are linked to system modules
- Permissions are available during role creation
- Permission changes are saved successfully

4.2.2 Create Roles with Permissions

**As an admin,
I want to create roles using defined permissions,
so that access can be controlled based on responsibilities.**

The admin creates roles (e.g., Admin, HR, Manager, Employee) by selecting relevant permissions for each module.

Acceptance Criteria

- Admin can create new roles

- Permissions can be assigned to roles
- Roles are reusable
- Role creation is saved successfully

4.2.3 Assign Role During Employee Creation

**As an HR staff member,
I want to assign a role to an employee during profile creation,
so that the employee receives appropriate system access.**

During employee creation, HR selects an existing role.
The system applies permissions based on the selected role.

Acceptance Criteria

- Role selection is mandatory
- Permissions are applied automatically
- Employee access matches assigned role
- Access is available immediately

4.2.4 Update Role Permissions

**As an admin,
I want to update permissions of an existing role,
so that access control can be adjusted when responsibilities change.**

When a role is updated, all users assigned to that role receive updated permissions automatically.

Acceptance Criteria

- Admin can edit existing roles
- Permission changes are saved
- Updates apply to all assigned users
- Changes are logged

4.2.5 View Roles and Permission Summary

As an admin,

**I want to view all roles and their permissions in one place,
so that I can easily review and manage system access.**

The system displays a list of roles with their associated permissions.

Acceptance Criteria

- All roles are listed
- Permissions are clearly visible
- Roles can be selected for editing

4.2.6 Add New Permissions to an Existing Role

As an admin,

**I want to add new permissions to an existing role,
so that roles can be enhanced without recreating them.**

When new permissions are created or when access requirements change, the admin can select an existing role and assign additional permissions to it.

All users assigned to that role automatically receive the newly added permissions.

Acceptance Criteria

- Admin can select an existing role
- Newly created or existing permissions can be added to the role
- Changes are saved successfully
- Updated permissions apply to all users assigned to the role
- Permission updates are logged

4.3 Employee Profile Viewing

4.3.1 View Own Employee Profile

As an employee,

I want to view my employee profile,

so that I can see my personal, job, and role-related information stored in the system.

When the employee navigates to the Profile section, the system displays their profile details in read-only mode.

Acceptance Criteria

- Employee can view personal details
- Job-related details are visible (designation, department, join date)
- Assigned role is visible
- Profile data is read-only for employees

4.3.2 View Employee Profile (HR / Admin)

As an HR staff member or admin,

I want to view employee profiles,

so that I can review employee information when managing the workforce.

HR or admin selects an employee from the employee list and opens the profile view screen. The system displays full employee details including role and status.

Acceptance Criteria

- HR and admin can view all employee profiles
- Employee details are displayed correctly
- Assigned role and status are visible
- Navigation back to employee list is available

4.3.3 View Employee Profile (Manager)

As a manager,

I want to view profiles of employees who report to me,

so that I can access relevant employee information when required.

Managers can view profiles of their direct reporting employees only.

Acceptance Criteria

- Manager can view profiles of reporting employees only
- Employee profile is displayed in read-only mode
- Access is restricted based on role
